                                          drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangictasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, a acute intermittent porphyria. The polymorphic forms can also be used forensics to identify individuals
                                                                                                        and
                                                                                 ij

Novel nucleic acids containing polymorphisms used in the diagnosis of.

WPI; 2000-107928/10

Chakravarti A,

Haluska MK

Claim 1; Page 22; 53pp; English

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential which combat the disease. The polymorphisms

disease,

be used to

potentia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria. The polymorphic forms can also be use forensics to identify individuals
The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to identify potential drugs which combat the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polycystic kidney disease; von Willebrands disease; forensic; h

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocycosis, von Willebrands disease, ruberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, a acute intermittent porphyria. The polymorphic forms can also be used forensics to identify individuals
         The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphism; hypertension; agammaglobulinemia; diabetes insipidus; Lesch-Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; von Willebrands disease; forensic; human; tuberous sclerosis; hereditary hemorrhagica telangiectasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 29

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   runey alsease, hereditary spherocytosis, on Willebrands disease, tuberous sclerosis, hereditary hemorphagica telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals
                                                      (PSES) promoter construct, which contains the androgen receptor core region (AREC3) promoter of the prostate-specific membrane antigen (PSMA) enhancer (PSMEdel2) promoter of the PSMA gene. The PSES promoter construct of the invention is useful for reducing angiogenesis in prostate carcinoma cells and in targeting prostate carcinoma cells for destruction. The PSES promoter construct is also useful for identifying an agent that modulates PSES promoter activity. The present DNA sequence represents a PCR primer that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    Novel chimeric PSES promoter construct comprising androgen receptor enhancer core region promoter of prostate-specific-antigen gene and PSME(del2) promoter of PSMA gene, useful for treating prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prostate-specific-antigen; PSA;
prostate-specific membrane antigen enhancer;

                                                                                                                                                                                                                                      500-1000bp fragments from an AluI-digest of human genomic DNA were ligated to M13mp19 RF DNA. E.coli JM109 were transformed by the ligation mixture. Filter replicates of the transformant colonies were screened with probe #1 and a second probe. The probes were derived from the Alu family consensus sequence. Phage which hybridised to both probes were plated at lower density and rescreened with the same probes. Singlestranded template DNA was extd. from cultures of these phage to isolate low-frequency repeat sequence probes LF1, LF2, LF3, LF19, LF20 and LF21. See also AAQ2913-Q29017 and AAQ29021-Q29038. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo

The present invention describes a method for determining the length of telomeres, involving hybridising a chromosomal DNA extracted from a sample and a labeled DNA probe with a sequence complementary to a repetitive telomeric sequence, and measuring the labeled signal of the hybridised probe to give the size of telomere. This can be used to investigate tissue aging and the progression of cancer and in monitorir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for determining the presence or susceptibility to Alzheimer's disease in humans, involving detecting genetic lesion in the presentiline-1 (PSENI) gene, found on chromosome 1 The genetic lesion is a polymorphism in the promoter or upstream regulatory region of the gene. The invention also describes transgenic animals which can be used to identify compounds useful in treating

                                                                                                                                                          telomeres, involving hybridising a chromosomal DNA extracted from a sample and a labeled DNA probe with a sequence complementary to a repetitive telomeric sequence, and measuring the labeled signal of the hybridised probe to give the size of telomere. This can be used to investigate tissue aging and the progression of cancer and in monitoring the progness of patients. The present sequence is an oligonucleotide described in the exemplification of the invention

Also included are the process for preparing the polypeptide by recombinant DNA technology, the application of the polypeptide in treating diseases such as cancer and HIV infection, the antagonist against the polypeptide (and its therapeutic action) and the application of the polypeptide encoding this polypeptide. The present sequence is an RT-(reverse transcriptase) PCR primer used to isolate cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to dete the presence of genetic golymorphisms associated with inflammatory bowe disease and correlating their occurrence with disease states. They may used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 54; 463pp; English.

The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of CC the polymorphisms is useful in designing prophylactic and therapeutic CC regimes customized to underlying abnormalities. The polymorphisms can be CC used for association studies for hypertension, and in hypertension with CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension. This information can be used to find the precise role in hypertension. This information can be used to find the precise role of a CC polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease e.g. agammaglobulinemia, diabetes consistion with other disease e.g. agammaglobulinemia, diabetes consistion with other diseases e.g. agammaglobulinemia, diabetes consistion, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic chidney disease, hereditary spherocytosis, von Willebrands disease, colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and cute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role in hypertension. This information can be used to find the precise role in C hypertension. This disease. The polymorphisms can be tested for chugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and caute intermittent porphyria. The polymorphic forms can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of CC the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be CC used for association studies for hypertension, and in hypertension CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in CC hypertension. This information can be used to find the precise role in CC polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease. The polymorphisms can be tested for CC association with other diseases e.g. agammaglobulinemia, diabettes CC insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, familial CC colonic polyposis, Ehlers-Danlos syndrome, osteogenessis imperfecta, and CC acute intermittent porphyria. The polymorphic forms can also be used in CC forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

CC The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of CC the polymorphisms is useful in designing prophylactic and therapeutic CC regimes customized to underlying abnormalities. The polymorphisms can be CC used for association studies for hypertension, and in hypertension of CC diagnostic assays. Where the polymorphisms have strong correlation with hypertension. This information can be used to find the precise role in CC polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease. The polymorphisms can be tested for CC insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolenia, polycystic cc kidney disease, hereditary spherocytosis, von Willebrands disease, familial colonic polyposis, Ehlers-Danlos syndrome, softeogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 318

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therappeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role in compart the disease, and this can be used to identify potential customy which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabettes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and conte intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The polymorphisms can be CC used for association studies for hypertension, and in hypertension CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in CC hypertension. This information can be used to find the precise role in CC drugs which combat the disease. The polymorphisms can be tested for CC association with other diseases e.g. agammaglobulinemia, diabetes CC insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic CC tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, C culonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC cotonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC cotonic polyposis. Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC cotonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC cotonic polyposis. Enlars pands disease, cotonic polyposis pands disease, cotonic pands disease, cotonic pands disease, cotonic pan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension. This information can be used to find the precise role in hypertension in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease e.g. agamaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberchytosis, ron Willebrands disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC regimes customized to underlying abnormalities. The polymorphisms can be considered to underlying abnormalities. The polymorphisms can be considered to assays. Where the polymorphisms have strong correlation with the hypertension, within a gene, they are likely to have a causative role in the polymorphisms can be used to find the precise role of a compartension. This information can be used to identify potential confunction with disease, and this can be used to identify potential consistency which combat the disease. The polymorphisms can be tested for consipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich consistency disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, colonic polyposis, Ehlers-Danlos syndrome, coteogenesis imperfecta, and coute intermittent porphyria. The polymorphic forms can also be used in corresponds to identify individuals

This invention describes a novel method for the genetic treatment hyperlipidemia by altering genes, in hepatocytes, for apoprotein E or Al. Low density lipoprotein (LDL) levels in the blood are recaltering an apo B gene (I) in a hepatocyte. The invention describe method for the therapeutic and/or prophylactic method involving al

describes are reduced

(apo) o H

A method has been developed for determining a patient's susceptibility t an inflammatory disorder. The method comprises the detection of an interleukin 1 (II-1) (44112332) haplotype in a sample obtained from the patient, where its presence indicates susceptibility to an inflammatory disorder. AAX16607 to AAX16631 represent PCR primer used in the method for detecting the II-1 (44112332) haplotype. The method provides kits for the early prediction of a patient's susceptibility to inflammatory artery disease, osteoporosis, nephropathy disorders, including coronary artery disease, osteoporosis, nephropathy

Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo B. E and Al genes is used to treat or prevent atherosclerosis, coronary heart disease, Alzheimer's disease, hypobetalipoproteinemia, and dysbetalipoproteinemia. AAZ09545-Z09548 represent primers used in the manipulation of the human Apo E protein described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 25
                                                                                                                                                                                                                                                                                                   New method of determining a patient's susceptibility to inflammatory disorders - by detecting the presence of an IL-1 (4411232) haplotype, useful in designing treatment strategies that modulate the activity of proteins produced by the IL-1 gene cluster.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             erythamatosus, lichen sclerosis and ulcerative colitis. The detection of alleles of the haplotype can be applied to particular inflammatory disorders, comprising diabetic retinopathy, juvenile chronic arthritis, psoriasis, and insulin dependent diabetes. The identification of a disease-associated haplotype enables determination of which alleles are causative, and this information is useful in designing treatment strategies, including gene therapy and treatment using various agents that modulate the activity of proteins produced by the IL-1 gene cluster. Some alleles from the IL-1 gene cluster are associated with particular inflammatory diseases, and insufficient IL-1 production appears to act centrally in the pathology of these diseases. Therefore, the use of IL-1 gene clusters is useful in determining genetic susceptibility to inflammatory diseases, including those with a multifactorial etiology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, single-nucleotide polymorphism; SNP; SNAP23; ss; PCR primer; synaptosome associated protein of 23 kilodaltons; diabetes; obesity; cardiovascular disorder; hypertension; cancer; drug screening; forensic medicine; paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
```

The invention relates to a nucleic acid between 10 and 100 bases comprising at least 10 contiguous nucleotides including a polymorphic site or an adjacent base, from 6 polymorphisms from 5 human genes, RGS5 (regulator of G-protein signalling 5), SNAP23 (synaptosome associated protein of 23 kilodaltons), ALDOB (aldolase B), GOS8/RGS2 (helix-loop-helix basic phosphoprotein) and PPPICB (not defined). The invention also nucleic acid comprising but polymorphisms in a method comprising analysing a nucleic acid comprising by obtaining nucleic acid samples from individuals, determining a base occupying any one of the polymorphic or other sites in linkage disequilibrium with them and testing each

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   និនិនិនិនិនិនិនិ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 325
          The invention relates to a nucleic acid between 10 and 100 bases CC comprising at least 10 contiguous nucleotides including a polymorphic comprising at least 10 contiguous nucleotides including a polymorphic cc site or an adjacent base, from 6 polymorphisms from 5 human genes, RGS5 CC (regulator of G-protein signalling 5), SNAP23 (synaptosome associated protein of 23 kilodaltons), ALDOB (aldolase B), COSB/RGS2 (helix-loop-cc helix basic phosphoprotein) and PPPICB (not defined). The invention also CC relates to using such polymorphisms in a method comprising analysing a nucleic acid comprising by obtaining nucleic acid samples from CC individuals, determining a base occupying any one of the polymorphic or CC individuals, determining a base occupying any one of the polymorphic or CC individual for the presence of a phenotype and correlating the presence CC individual for the presence of a phenotype and correlating the presence CC individual for the presence of a phenotype and correlating the presence CC determined is used as a diagnostic tool for diseases such as diabetes, CC cancers. The polymorphisms may also be used for drug screening, with other contractive traces and could be resented for association with other contractive traces and could be resented for association with other contractive traces and could be resented for association with other contractive traces and could be resented.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   individual for the presence of a phenotype and correlating the presence of the disease phenotype with the base. The linkage disequilibrium thus determined is used as a diagnostic tool for diseases such as diabetes, obesity, cardiovascular disorders, hypertension and some forms of cancers. The polymorphisms may also be used for drug screening forensics, paternity tests and could be tested for association with other diseases. The present sequence is a PCR primer used to amplify a region containing an SNP (single-nucleotide polymorphism) from human SNAP23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ma Y,

                                                                                         The present invention relates to a new oligonucleotide label-domain comprising the sequence (CTATTTT) n and its complement (AAAATAG) n, where n is 1. The probe sets of the invention are useful for detecting kappa or lambda-immunoglobulin light chain mRNA or corresponding heteronuclear RNA, CMV (cytomegalovirus) immediate early RNA, EBV (Epstein-Barr virus) early RNA 1 and RNA 2, and human Alu repetitive satellite genomic sequences. The invention is a useful generic sequence for incorporation into oligonucleotide probes for detecting gene-specific sequences within cells or tissue samples in in situ hybridisation analysis and for attaching a label to immunoglobulins or other proteins for detecting haptens and antigens in immunohistochemical analyses. The present nucleic acid sequence represents one of a collection (ABK70376-ABK70501) of oligonucleotide probes that were used in the invention for detecting or localising a plurality nucleic acid target gene or antigen within a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diseases.
                                                                                                                                                                                                                                                                                                                                      probes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                      The present invention relates to methods for identifying a test substance CC that modulate the immune response in a genotype specific manner. Methods CC of the invention involve genotyping subjects to identify those having a CC genotype (e.g. interleukin-1; IL-1) associated with one or more CC inflammatory disorder. The method comprises genotyping a subject having a CC an inflammatory disease-associated genotype and observing a biomarker in CC the subject before and after the subject is contacted with the test CC substance. The methods or cells associated with inflammatory diseases are CC aspecific biological response in subjects having inflammatory diseases are CC associated genotype, where the genotype is associated a pre-disposition to one or more of periodontal disease, coronary artery disease, CC Alzheimer's disease, atherosclerosis, osteoporosis, insulin-dependent CC diabetes, diabetic retinopathy, end-stage renal disease, diabetic retinopathy, end-stage renal disease, diabetic CC nephropathy, hepatic fibrosis, alopecia areata disease, diabetic contacted arthritis, juvenile chronic arthritis, complete sclerosis, idiopathic pulmonary fibrosis, sepsis and acne. The CC multiple sclerosis, idiopathic pulmonary fibrosis, sepsis and acne. The CC multiple sclerosis, idiopathic pulmonary fibrosis, sepsis and acne. The complication of the invention for cenotyping IL-1A (925/926) gene. This primer is used in the second of the invention for cenotyping IL-1A (925/926) gene. This primer is used in the second of the invention for cenotyping IL-1A (925/926) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 327
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immune response; insulin-dependent diabetes; diabetic retinopathy; renal disease; diabetic nephropathy; hepatic fibrosis; alopecia area; Graves disease; Graves ophthalmopathy; systemic lugus erythematosus; extrathyroid disease; lichen sclerosis; juvenile chronic arthritis; rheumatoid arthritis; gastric cancer; ulcerative colitis; asthma; interstitial lung disease; idiopathic pulmonary fibrosis; sepsis; multiple sclerosis; acne; cardiant; dermatological; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening a substance in a subject for modulating an immune response, comprises genotyping to identify the test subject, and observing a biomarker before and after contacting the subject with the test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer #1, used for genotyping human IL-1A (gz5/gz6) marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome 1fp11.2 and MDZ12 is encoded at chromosome 15g26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADB04743 standard; DNA;

                                                                                                                                                                                                                                                                                                          The present invention provides a method for determining the predisposition of a subject to early-onset menopause (EOM). The invention is useful in diagnosing, treating and preventing early-onset menopause. The present sequence is human secreted interleukin-1A (IL-1A) amplifying PCR primer. The sequence is used in exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-OCT-1999.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a PCR primer used to isolate DNA encoding the Interleukin-6 G-CSF related factor (SGRF) protein of the invention. The protein as member of the II-6/G-CSF/MSF family. The protein can be used in drugs for treating diseases due to abnormality of cell proliferation in the immune system and haematopoietic system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-013230/01

The PCR primers are used to amplify a coligonucleotides of the invention. The pCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC assess by association analysis the genotype of an individual or group of cindividuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cagammaglobulinaemia, diabetes insiplous, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consists and include symptoms of or susceptibility to multifactorial confidence, including, rheumatoid arthritis, multiple sclerosis, microgranism. The method is also useful in forensic investigations and primer extension (SNPE) primer specific for a human SNP containing DNA comparer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC A novel method for simultaneously determining the level of a number of control target polynucleotides in a sample has been disclosed. The method converted to the target levels in the varget sequence in direct correction to the target levels in the original sample. The target correction to the target levels in the original sample. The target corrected with either first or second adaptor sequences. The first and corrected with either first or second adaptor sequences. The first and corrected with either first or second adaptor sequences. The first and corrected with either first or second adaptor sequences. The first and correct through the target sequences. The adaptor sequences are then removed to leave target sequences in the adaptor sequences are then polymerised to form dimer multimers. The relative abundances of target identifiers in the multimer allow expression levels to be determined. This method is useful corrected under various conditions, stages of development and and disease tates, particularly where the target polymucleotide is present at low correctly. The method may also be used in the discovery and evaluation of addition to the method described above, the invention also includes the polymucleotide and polypeptide of P2. P2 is thought to be a member of a novel chemokine family, denoted CX5C and may be associated with immune function. Compositions of the P2 polymucleotide may be associated with immune correctly shock and conditions involving immune system hypersensitivity. The P2 polymucleotide to treat conditions using gene cutoff the passed to chromosome 5, within the cytokine gene cluster at 5q3l. The present sequence is the reverse primer conditions under the reverse primer and interleukin 10

The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antilinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel neural thread protein peptide, referred as cell death peptide, useful for treating prostatic hyperplasia, psoriasis, eczema, dermatos atherosclerosis, cosmetic modification to skin, throat, mouth, muscle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 17; 77pp; English.

```

sequence as given in the specification, or a receptor protein in which one or more amino acid residues are substituted, added or deleted, that expresses on the B-cell surface membrane of a non-gamma globulin diseased patient. The polypeptide of the invention demonstrates immunosuppressive activity and may be useful for screening a B-cell-associated disease

s to a novel LRRC8 protein comprising the specification, or a receptor prot

The current sequence is that of the RT-PCR primer 2 o the invention which is related to the human LRRCB mutant that is
                                                                                             The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich annotrome. Fahrya disease familial hymeryheiderterolamia columniation of the proventical and the precise familial hymeryheiderterolamia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                     The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to d the presence of genetic polymorphisms associated with inflammatory b disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention

                                                                                                                                                                                                               The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to othe presence of genetic polymorphisms associated with inflammatory k disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                           Testing for the bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                         for ethnic affiliation and thus for estimating ethnic affiliation, as well as for determining an ethnic specific haplotype, estimating genetic affiliation and during forensic analysis. The 3' A-rich region of the Alu repeat used within the method is a 'hot spot' for diversity making this region very useful for forensic analysis. The current sequence is that of the PCR primer F1209 of the invention which was used to sequence the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               achieved via obtaining haplotypes from specific DNA sequence analysis comparing haplotypes from human donors of known ethnic origin with expected haplotype frequency. The DC is used as an ethnic descent predictor. The method of the invention may be useful for determining a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining discriminant function coefficient for ethnic affiliation, comprises comparing haplotypes from donors of known ethnic origin with expected haplotype frequency and estimating coefficient from obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method which comprises determining discriminant function coefficient (DC) for ethnic affiliation.
                                                                                                               Human inflammatory bowel disease associated polymorphic site #636.
                                                                                                                                                                                                       AAH91561 standard;
                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 2; Col 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            misc_feature

                      To obtain vector p9lox5, a SalI cohesive-ended duplex containing a lox sequence from the phage P1 lox/Cre recombinase system was made by annealing oligos B16 (AAQ71187) and B17 (AAQ71188) and cloning into SalI-cleaved pUC9. Primer 614 (AAQ71189), designed from a consensus Alu repeat sequence, was used to prime amplification of the inter-Alu region of genomic DNA from line B2.13, which contains human chromosome-11 in a CHO background. The product was ligated to p9lox5 by turbo cloning. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences represented in AAQ14004-32 and AAQ14728-33 are used in examples of the specification, illustrating the method of the inventi Oligonucleotides AAQ14016-29 and AAQ14728-33 are linkers, displacers targets. Nomenclature: X=XmaI restriction site T=target D=polarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Branch migration of nucleotide(s) - using one strand of recipient polydeoxy-nucleotide sequence and displacer sequence of single-stranded DNA

                                                                                                                          This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97933 represent PCR primers and probes used in the amplification and isolation of the NOVX polymorphic represented in ABX97080-ABX97185 which encode the polypeptides represented in ABX95041-ABU65218. The probes described in the invention are modified at the 5'-ard by more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-NOV-2001;

The invention relates to an isolated polypeptide (designated NOVX, or CC NOV1-NOV127) comprising a sequence selected from 178 fully defined amino CC acid sequences (and their mature forms, variants and fragments). Also CC included are an isolated nucleic acid molecule encoding NOVX, a vector CC comprising the nucleic acid, a cell comprising the vector, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian cc subject, a method for identifying an agent that binds to the above polypeptide, a method for identifying a potential therapeutic agent for use in the treatment of a pathology that is related to aberrant cc expression or physiological interactions of the polypeptide, a method of screening for a modulator of activity or of latency or predisposition to greening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating ct the activity of the polypeptide citted above. The composition and methods are useful for diagnosing, preventing or treating diseases such as cc ancer, neurodegenerative disorders like Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders, cancer also used in Cc chromosome mapping, tissue typing, preventive medicine and cc pharmacogenomics. The polypeptides are also useful as vaccines. The compositione and cc pharmacogenomics is an RTQ-PCR (real time quantitative PCR) probe used to

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking cc sites of single nucleotide polymorphisms SNPs. The present invention cc includes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The collgonucleotides are useful for determining the presence, absence or clentity of a SNP and for genotyping nucleic acid sample by performing a single-nucleotide primer extension reaction. The cc identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune cd disease of which a component is or may be genetic such as autoimmune inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

cc includes kits for determining the presence or absence of a SNP, using the colligonucleotides of the invention. The PCR primers are used to amplify a CSNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by colligonucleotides are useful for genotyping a nucleic acid sample by colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or clantity of a SNP and for genotyping nucleic acid samples, for e.g. to cassess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular consteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consteogenesis include acomponent is or may be genetic such as autoimmune cc disease of which a component is or may be genetic such as autoimmune cc diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC sNP flanking sequence, the SNPE primer is used as a genotyping primer. CC the oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include disease e.g. CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic ctraits also include symptoms of or susceptibility to multifactorial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogeni microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA
                     The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to d the presence of genetic polymorphisms associated with inflammatory b disease and correlating their occurrence with disease states. They used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; inflammatory bowel disease; Crohn's disease; ulcerative cosingle nucleotide polymorphism; SNP; chromosome 19p13; paternity chromosome 5q31-33; forensic test; gene therapy; ds.

                                                                                                                                                                                                                  The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human transglutaminase 12 (see AAG78882). The transglutaminase and its coding sequence are useful in the diagnosis and treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primer which was used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human transglutaminase 12 and encoded polynucleotide, used in diagnoused treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; transglutaminase 12; cytostatic; virucidal; immunomodulatory; antiinflammatory; haemostatic; gene therapy; malignant tumour; haemopathy; HIV infection; immunological disease; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 351
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents PCR primer #2, used to amplify human RAD51 gene at position -2339 upstream of the transcription start site of human RAD51 gene. The RAD51 gene is useful in diagnosing genetic predisposition or susceptibility to breast cancer in an individual using the following steps: (1) detecting a mutation in the RAD51 gene in a human subject, comprising analysing a sample from the subject to detect the mutation; (2) assessing the risk of developing breast cancer, comprising; (a) analysing a sample from the subject for the presence of BRCA1 and/or BRCA2 mutations; and (b) if (a) is positive, analysing the sample for a mutation in the RAD51 gene, where the presence of the RAD51 mutation in compared to a subject having at least one of the BRCA mutations and a wild-type RAD51 gene. Primers derived from the sequence can be used in a kit for detecting a mutation in the RAD51 gene of a subject, which is associated with a predisposition to breast cancer, comprising at least 2 nucleic acid primers derived from the RAD51 gene sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ព្រព្ពន្ធន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    뭉
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                              The invention relates to human argininase 9 (AAM49102), nucleic acids commoding it (ABA96911), and a method for the recombinant production of CC argininase 9. The protein has a molecular weight of 9 kD and has homology cover a 60 amino acid stretch to the protein fragment shown in AAM49105. CC The present invention additionally discloses an antagonist of argininase CC argininase 9. Argininase 9, and an antibody which specifically binds to argininase 9. Argininase 9, and nucleotides which encode it may be used CC argininase or urea metabolism, developmental disorders, malignant tumours, compared to screen for modulators of its activity or for peptide CC used to screen for modulators of its activity or for peptide CC immune disorders and inflammatory conditions. The protein may also be CC used to screen for modulators of its activity or for peptide CC for nucleic acid amplification reactions or as a probe for hybridisation CC exemplification, or in producing gene chips or microarrays. Sequences ABA96912-CC ABA96913 represent reverse transcription-PCR (RT-PCR) primers used in an CC exemplification of the invention to isolate human argininase 9 cDNA. CC ID NO:3 (ABA96914) which is given on page 12 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                  The present invention describes human breast susceptible gene coded protein 10.45 (I). Also described is a process for preparing (I) using DNA recombination techniques. (I) can be used for treating several diseases e.g. embryotic development deformity and tumours. The present sequence represents a PCR primer for (I), which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                          A novel human breast susceptible gene coded protein 10.45 polypeptide, and the polynucleotide encoding it, useful for treating several diseases e.g. embryotic development deformity and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                               Mao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          embryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABQ83933 standard; DNA; 24 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a recombinant expression construct encoding a reporter gene operably linked to a promoter from a mammalian gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct is useful for identifying compounds that inhibit the induction of genes induced by CDK inhibitors. The compounds are useful for preventing or treating a disease caused by CDK inhibitor induced gene expression, e.g. cancer other than colon cancer, renal failure, Alzheimer's disease, amyloidosis, age-related diseases, atherosclerosis or arthritis. The present sequence is a PCR primer used to amplify a human promoter suitable for use in the construct of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; cyclin-dependent kinase; CDK; cyclin-dependent kinase inhibitor; inhibitor; cancer; age-related disease; promoter; atherosclerosis; cytostatic; antiarteriosclerotic; nootropic; neuroprotective; nephrotropic; antiarthritic; arthritis; renal disease; Alzheimer's disease; amyloidosis; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
